Issue 2 of this User Guide applies to controller software version 2.01 and greater
Installation and Basic Operation

1. What Instrument Do I Have?

Thank you for choosing the 3216 Temperature Controller/Programmer.

This User Guide takes you through step by step instructions to help you to install, wire, configure and use the controller.

For features not covered in this User Guide, a detailed Engineering Manual, Part No HA027986, and other related handbooks can be downloaded from www.eurotherm.co.uk.

The controller may have been ordered to a hardware code only or pre-configured using an optional "Quick Start" code.

The label fitted to the side of the sleeve shows the ordering code that the controller was supplied to where the last two sets of five digits show the Quick Code. If the Quick Code shows X0000/XXXX the controller will need to be configured when it is first switched on.

1.1 Unpacking Your Controller

The following items are included in the box:

- Controller mounted in its sleeve
- Two panel retaining clips mounted on the sleeve
- IP65 sealing gasket mounted on the sleeve
- Component packet containing a snubber for each relay output (see section 3.5) and a 2.49Ω resistor for current inputs (see section 3)
- This User Guide

3216 User Guide Part No. HA027985ENG Issue 2.0 May 04

1.2 Dimensions

A general view of the controller is shown below together with overall dimensions.

![Diagram of controller dimensions]
1.3  Step 1: Installation
This instrument is intended for permanent installation, for indoor use only, and enclosed in an electrical panel. Select a location which is subject to minimum vibrations and the ambient temperature is within 0 and 55°C (32 - 131°F). The instrument can be mounted on a panel up to 15mm thick. To ensure IP65 and NEMA 4 front protection, mount on a non-textured surface. Please read the safety information in section 4 before proceeding and refer to the EMC Booklet part number HA025464 for further installation information.

1.3.1  Panel Mounting the Controller
1. Prepare a square cut-out in the mounting panel to the size shown. If a number of controllers are to be mounted in the same panel they should be spaced as shown.
2. Fit the IP65 sealing gasket, if required, behind the front bezel of the controller.
3. Insert the controller through the cut-out.
4. Spring the panel retaining clips into place. Secure the controller in position by holding it level and pushing both retaining clips forward.
5. Peel off the protective cover from the display.

1.3.2  To Remove the Controller from its Sleeve
The controller can be unplugged from its sleeve by easing the latching ears outwards and pulling it forward out of the sleeve. When plugging it back into its sleeve, ensure that the latching ears click back into place to maintain the IP65 sealing.

2. Order Code

Quick Start Code

3216 User Guide  Part No. HA027985ENG  Issue 2.0  May 04
3. Step 2: Wiring

3.1 Terminal Layout

Check order code of the controller supplied

Input/Output 1
- Digital
- Output - Relay or Logic or DC

Output 2
- Relay or Logic or DC

Line Supply
- 85 to 264Vac
- 50/60Hz

OR

Low Voltage Supply
- 24Vac/dc

Digital Communications
- RS232
  - Connect directly to comms port of PC
- RS485
  - Daisy chain to further controllers/comms converter to PC

3.2 Wire Sizes
The screw terminals accept wire sizes from 0.5 to 1.5 mm (16 to 22AWG). Hinged covers prevent hands or metal making accidental contact with live wires. The rear terminal screws should be tightened to 0.4Nm (3.5lb in).

3.3 PV Input (Measuring Input)
- Do not run input wires together with power cables
- When shielded cable is used, it should be grounded at one point only
- Any external components (such as zener barriers, etc) connected between sensor and input terminals may cause errors in measurement due to excessive and/or un-balanced line resistance or possible leakage currents

3.3.1 Thermocouple Input
- For thermocouple input use the correct compensating cable preferably shielded

3.3.2 RTD Input
- The resistance of the three wires must be the same. The line resistance may cause errors if it is greater than 22Ω

3.3.3 Linear Input (mA or V)
- A line resistance for voltage inputs may cause measurement errors
- Volts input (input resistance 100KΩ). An external adaptor is required, Part No. 5UB21/1
- For mA input connect the 2.49Ω burden resistor, supplied, across the + and - input

3.4 AA Output Relay (Optional)
- Changeover relay (Form C) rated 2A 264Vac resistive
3.5 Input/Output 1 (Relay or Logic or DC - Optional)

This is optional and may be logic input, logic output, relay output or 0-20mA dc output:

<table>
<thead>
<tr>
<th>Output</th>
<th>Relay</th>
<th>Normally open (Form A), 2A 254Vac resistive</th>
</tr>
</thead>
<tbody>
<tr>
<td>Logic</td>
<td>Drive to SSR (not isolated)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Logic level On/High - 12Vdc at 5 to 40mA max</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Logic level Off/Low - &lt;100mV &lt;100uA</td>
<td></td>
</tr>
<tr>
<td>DC</td>
<td>0-20mA, load 5000Ω max, cal accuracy 1% +100μA offset</td>
<td></td>
</tr>
<tr>
<td>Input</td>
<td>Logic (Digital)</td>
<td>Contact closure 12V @ 5-40mA</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Contact open &gt; 500Ω</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Contact closed &lt; 200Ω</td>
</tr>
</tbody>
</table>

3.6 Output 2 (Relay or Logic or DC - Optional)

This is optional and is output only. It may be relay, logic or 0-20mA dc output as Output 1.

* General Note About Relays and Inductive Loads

High voltage transients may occur when switching inductive loads such as some contactors or solenoid valves. Through the internal contacts, these transients may introduce disturbances which could affect the performance of the instrument. For this type of load it is recommended that a 'snubber' is connected across the normally open contact of the relay switching the load. The snubber recommended consists of a series connected resistor/capacitor (typically 15nF/100Ω). A snubber will also prolong the life of the relay contacts.

WARNING

When the relay contact is open or it is connected to a high impedance load, the snubber passes a current (typically 0.6mA at 110Vac and 1.2mA at 240Vac). You must ensure that this current will not hold on low power electrical loads. If the load is of this type the snubber should not be connected.

3.7 Digital Communications (Optional)

Digital communications uses the Modbus protocol. The interface may be ordered as RS232 or RS485 (2-wire).

![Diagram of RS232 Connections](image)

HE Rx
HF Tx
Local Ground

Daisy Chain to further controllers

![Diagram of RS485 Connections](image)

HD Common
HE Rx
HF Tx
Twisted pairs

RS232/RS485 2-wire communications converter eg KD485
3.8 Current Transformer/Logic Input (Optional)
A current transformer can be connected directly to the controller to monitor the actual rms current supplied to an electrical load.

3.8.1 Current Transformer Input (CT)
CT input current 0 to 50mA rms (sine wave, calibrated) 50/60Hz. A burden resistor, value 10Ω, is fitted inside the controller. It is recommended that the current transformer is fitted with a voltage limiting device, such as two back to back zener diodes between 3 and 10V and rated for 50mA.

CT input resolution 0.1A for scale up to 10A, 1A for scale 11 to 100A
CT input accuracy ±4% of reading

3.8.2 Logic Input (LA)
A digital (logic) input from a volt free contact can be configured to select Setpoint 2, Keylock, Timer Run/Hold, Timer Reset, Alarm Acknowledge or Auto/Manual.

Digital Input
- Contact closure 12V @ 5-40mA
- Contact open > 500Ω
- Contact closed < 200Ω

Note: This supplies 12Vdc at up to 10mA to terminal LA
The common connection is shared for each of these inputs and is, therefore, not isolated.

3.9 Power Supply
1. Before connecting the instrument to the power line, make sure that the line voltage corresponds to the description on the identification label. Use copper conductors only.
2. For 24V the polarity is not important
The power supply input is not fuse protected. This should be provided externally: Instrument fuse ratings are as follows:
- For 24 V ac/dc fuse type T rated 2A 250V
- For 85/265Vac fuse type T rated 2A 250V

3.10 Example Wiring Diagram
This example shows heat/cool temperature controller where the heater control uses a SSR and the cooling control uses a relay.

Safety requirements for permanently connected equipment state:
- A switch or circuit breaker shall be included in the building installation
- It shall be in close proximity to the equipment and within easy reach of the operator
- It shall be marked as the disconnecting device for the equipment
Note: a single switch or circuit breaker can drive more than one instrument
4. Installation Safety Requirements

Safety Symbols
Various symbols may be used on the controller. They have the following meaning:

⚠️ Caution, (refer to accompanying documents)  ☑️ Equipment protected throughout by DOUBLE INSULATION

Personnel
Installation must only be carried out by suitably qualified personnel.

Enclosure of Live Parts
To prevent hands or metal tools touching parts that may be electrically live, the controller must be enclosed in an enclosure.

Caution: Live sensors
The controller is designed to operate with the temperature sensor connected directly to an electrical heating element. However you must ensure that service personnel do not touch connections to these inputs while they are live. With a live sensor, all cables, connectors and switches for connecting the sensor must be mains rated.

Wiring
It is important to connect the controller in accordance with the wiring data given in this guide. Take particular care not to connect AC supplies to the low voltage sensor input or other low level inputs and outputs. Only use copper conductors for connections (except thermocouple inputs) and ensure that the wiring of installations comply with all local wiring regulations. For example in the UK use the latest version of the IEE wiring regulations, (BS7671). In the USA use NEC Class 1 wiring methods.

Power Isolation
The installation must include a power isolating switch or circuit breaker. This device should be in close proximity to the controller, within easy reach of the operator and marked as the disconnecting device for the instrument.

Overcurrent protection
The power supply to the system should be fused appropriately to protect the cabling to the units.

Voltage rating
The maximum continuous voltage applied between any of the following terminals must not exceed 264Vac:

- relay output to logic, dc or sensor connections;
- any connection to ground.

The controller must not be wired to a three phase supply with an unearthed star connection. Under fault conditions such a supply could rise above 264Vac with respect to ground and the product would not be safe.

Conductive pollution
Electrically conductive pollution must be excluded from the cabinet in which the controller is mounted. For example, carbon dust is a form of electrically conductive pollution. To secure a suitable atmosphere in conditions of conductive pollution, fit an air filter to the air intake of the cabinet. Where condensation is likely, for example at low temperatures, include a thermostatically controlled heater in the cabinet.

Over-temperature protection
Where damage or injury is possible, we recommend fitting a separate over-temperature protection unit, with an independent temperature sensor, which will isolate the heating circuit.

Please note that the alarm relays within the controller will not give protection under all failure conditions.

Installation requirements for EMC
To ensure compliance with the European EMC directive certain installation precautions are necessary as follows:

For general guidance refer to Eurotherm Controls EMC Installation Guide, HA025464.

When using relay outputs it may be necessary to fit a filter suitable for suppressing the emissions. The filter requirements will depend on the type of load. For typical applications we recommend Schaffner FN321 or FN612.
5. Switch On

A brief start up sequence consists of a self test in which all elements of the display are illuminated and the software version number is shown. What happens next depends on one of two conditions:

1. The instrument is new and has been supplied un-configured (go to section 5.1)
2. The instrument has been supplied configured in accordance with the Quick Start code (go to section 5.3)

5.1 Initial Configuration

If the controller has not previously been configured it will start up showing the ‘Quick Configuration’ codes. This is a built in tool which enables you to configure the input type and range, the output functions and the display format.

The quick code consists of two ‘SETS’ of five characters. The upper section of the display shows the set selected, the lower section shows the five digits which make up the set. Adjust these as follows:-

1. Press any button. The characters will change to '-' the first one flashing. '#' indicates the option is not fitted
2. Press < or > to change the character currently flashing to the required code shown in the quick code tables.
3. Press < or > to scroll to the next character. If you need to return to the first character press >. When all five characters have been configured the display will go to Set 2.

When the last digit has been entered press < again, the display will show To SET 1 Press < or > to YES.

The controller will automatically go to the operator level.

5.3 Pre-Configured Controller or Subsequent Starts

The controller will briefly display the quick codes during start up but will then proceed to operator level 1.

Note:- If the Quick Codes do not appear during start up this means that the controller has been re-configured in a deeper level of access, as stated above, and the Quick Codes may no longer be valid. The controller will power up in mode it was in prior to shutdown and you will see the display shown below. It is called the HOME display.
5.4 Operator Interface

**Beacons:**
- OP1 lit when output 1 is ON (normally heating)
- OP2 lit when output 2 is ON (normally cooling)
- OP4 lit when AA relay is ON (normally alarm)
- SPX Alternative setpoint in use (SP2)
- ALM Alarm active (Red)
- REM Remote setpoint or communications active
- RUN Timer running
- RUN (flashing) Timer in hold
- MAN Manual

**Operator Buttons:**
- From any display - press to return to the HOME display
- Press to select a new parameter. If held down it will continuously scroll through parameters.
- Press to decrease an analogue value or to change the state of a digital (enumerated) value
- Press to increase an analogue value or to change the state of a digital (enumerated) value

---

5.4.1 To Set The Required Temperature.

From the HOME display:

- Press \(\uparrow\) to raise the setpoint
- Press \(\downarrow\) to lower the setpoint

The new setpoint is entered when the button is released and is indicated by a brief flash of the display.

5.4.2 Alarm Indication

If an alarm occurs the red ALM beacon will flash, a scrolling message will give the source of the alarm and the alarm (relay) output will operate.

Press \(\circ\) and \(\square\) (ACK) together to acknowledge

If the alarm is still present the ALM beacon lights continuously.

The action which takes place depends on the type of alarm configured:

- **Non latching**
  - A non latching alarm will reset itself when the alarm condition is removed

- **Auto Latching**
  - An auto latching alarm requires acknowledgement before it is reset. The acknowledgement can occur BEFORE the condition causing the alarm is removed.

- **Manual Latching**
  - The alarm continues to be active until both the alarm condition is removed AND the alarm is acknowledged. The acknowledgement can only occur AFTER the condition causing the alarm is removed.
5.4.3 Auto/Manual/Off Mode

Auto mode is the normal closed loop operation where the output is adjusted automatically by the controller in response to a change in the input signal.

Manual mode means that the controller output power can be adjusted directly by the user. The input sensor is still connected and reading the PV but the control loop is open. The current level of the power output is adopted at the point of switch over from Auto to Manual. This is referred to as 'Bumpless Transfer'. The power output can be increased or decreased using the or buttons. Similarly, when Manual to Auto is selected the current manual output power is taken and the controller will then take over control. If the controller is powered down it will resume the same mode when powered up again.

Off mode can be selected or when using a timer configured to turn the power output off at the end of a timed period.

⚠ Manual operation must be used with care and the power level set must be chosen such that no damage can occur to the process. The use of a separate 'over-temperature' controller is recommended.

5.4.4 To Select Manual Operation and Adjust the Output Power

Press and hold and (Mode) together for more than 1 second. This can only be accessed from the HOME display.

1. 'Auto' is shown in the upper display. The lower display will scroll the longer alternate description of this parameter, ie ‘UOP M O I E – A U T O M A N A U T O L D P’
2. Press to select ‘Man’. This is shown in the upper display and the MAN beacon is lit.
3. The controller will return to the HOME display. The upper display shows PV. The lower display shows demand power. At the point of changeover the manual demand power is the same as it was when in Auto (bumpless transfer auto to manual).
4. Press or to lower or raise the power. The output power is continuously updated when these buttons are pressed.
5. The loop can also be turned off (zero power output demand) by selecting 'OFF' in the upper display. Loop break is also turned off. The controller will return to the HOME display. The upper display shows the PV. The lower display shows OFF. The MAN beacon is lit in this mode.
6. To Return to Automatic operation, press and together. Then press to select ‘Auto’. At the point of changeover to automatic operation the power demand takes the current value and gradually changes to that required by the controller bumpless transfer manual to auto.)
5.4.5 Other Commonly Used Operator Parameters Available in Level 1

Operator level 1 is designed for day to day operation of the controller and parameters are not protected by a security code.

Press \( \Delta \) to scroll through a list of commonly used parameters.

A list of other operating parameters is available each time this button is pressed. The parameter mnemonic and its scrolling description are shown in the lower display. The value of the parameter is shown in the upper display. The actual parameters shown depend upon the functions configured and are:

<table>
<thead>
<tr>
<th>Parameter Mnemonic and Scrolling Display</th>
<th>Description</th>
<th>Alterability</th>
</tr>
</thead>
<tbody>
<tr>
<td>WRK.OP WORKING OUTPUT</td>
<td>The current output</td>
<td>Shown when the controller is in AUTO or OFF mode and is read only</td>
</tr>
<tr>

<td>Load current</td>
<td>Read only and only shown if CT is configured</td>
</tr>
</tbody>
</table>

6. Operator Level 2

Level 2 provides access to additional parameters and access to these is protected by a security code.

6.1 To Enter Level 2

1. From any display press and hold \( \Delta \).
2. After a few seconds the display will show \( \text{LE}u \ 1 \ GOTO \).
3. Release \( \Delta \).
(Final button is pressed for about 45 seconds the display returns to the HOME display)

4. Press \( \Delta \) or \( \nabla \) to choose \( \text{LE}u \ 2 \) (Level 2)
5. Press \( \Delta \) or \( \nabla \) to enter the correct code
6. By default this is set to 2
   if an incorrect code is entered the display reverts to Level 1.

6.2 To Return to Level 1

1. Press and hold \( \Delta \).
2. Press \( \Delta \) to select \( \text{LE}u \ 1 \).

It is not necessary to enter a code when going from a higher level to a lower level. When Level 1 is selected the display reverts to the HOME display.
### 6.3 Level 2 Parameters

Press "<" to scroll through the list of parameters. The mnemonic of the parameter is shown in the lower display, followed once by a scrolling help message giving a longer description of the parameter.

The value of the parameter is shown in the upper display. Press "A" or "D" to adjust this value. If no key is pressed for about 30 seconds the display returns to "HOME".

Backscroll is achieved when you are in the list by pressing "A" while holding down "D".

</table>

**ID**
- **CUSTOMER ID** is a number from 0 to 9999 entered as a customised identification number for the controller

**REC.NO**
- **CURRENT RECIPE NUMBER** the most frequently used parameters can be stored in up to 5 recipes. This parameter selects the recipe to use.

**STORE**
- **RECIPE TO SAVE** the most frequently used parameter s can be stored in up to 5 recipes. This parameter allows you to store the current values in recipe numbers 1, 2, 3, 4, or 5. None does not store values.

Press at any time to return immediately to the HOME screen at the top of the list.

Hold down to continuously scroll through the above list.

---

### 6.4 Timer

A timer can be configured to operate in four different modes. These can be selected in Level 2 using the ‘TM.CFG’ parameter as:

- Dwell Timer
- Delayed switch on timer
- Soft start timer
- Programmer if this has been ordered

There are four operating states:

1. **Run.** This starts the timer
2. **Hold.** This stops the timer at the elapsed time. It will start again from the elapsed time when Run is selected again.
3. **Reset.** This sets the timer back to zero. It can be run again from this state.
4. **End cannot be set - it occurs automatically when the timer has counted down to zero

Run, Hold and Reset may be set through the front panel as described in section 6.8 or by the following methods:

- Edge trigger a suitably configured digital input
- Power cycle the controller
- Digital communications command
- Selecting ‘T.STAT’ from the parameter list

Switching from Hold to Run through the front panel buttons is not allowable if the Hold status is forced by a logic input or through Digital Communications.
6.4.1 Timer Beacon

Timer operation is indicated by a beacon labelled RUN:

<table>
<thead>
<tr>
<th>Timer Status</th>
<th>RUN beacon</th>
<th>Timer Status</th>
<th>RUN beacon</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reset</td>
<td>Off</td>
<td>Hold</td>
<td>Flashing</td>
</tr>
<tr>
<td>Run</td>
<td>On</td>
<td>End</td>
<td>Off</td>
</tr>
</tbody>
</table>

6.4.2 Logic Outputs

The timer may be configured to operate an output when it is running or during the end state.

Note:
- **Power up** - the 'run' state is selected if a Soft Start or Delay timer is configured or the 'Reset' state is selected if a Dwell timer is configured.
- **Auto/Manual** is only available when the timer is in Reset.
- **Ramp Rate** - it is recommended that ramp rate is used only with a Dwell type timer.

Quick access to the timer operating parameters is available in Level 2 by pressing \( \text{button} \). Repeat pressing of this button shows Timer Status, Dwell, Working Output, SP1, SF2, etc.

6.4.3 Power Cycling

If the power is turned off when the timer is running it will come back on as follows:
- For a Dwell type timer it will come back on in Reset.
- For a Delayed Switch on timer or a Soft Start timer, the controller will come back on in the Run condition and start again from the beginning.

---

6.5 Dwell Timer

A dwell timer (TTLCFG = 'DWELL') is used to control a process at a fixed temperature for a defined period. The action which occurs at the end of the timed period depends on the configuration of the 'END.T' parameter.

---

**Notes:**
1. If 'THRES' = 2^p (for example) timer will show TIMER RUNNING with the RUN beacon on but will not start counting down until the temperature is, first, within 2^p of SP. Then the threshold is ignored.
2. The dwell period can be reduced or increased when the timer is running. If it is reduced to meet the Time Elapsed the timer will change to the End state.
3. A-M can only be selected when in reset.
4. If the timer is re-configured to a different type or the End Type is re-configured (a dwell, for example), it may be necessary to reselect Auto mode.
6.6 Delayed Switch On Timer
The timer is used to switch on the output power after a set time.
When the timer status = run, the control output is off
When the timer status = reset, the control output is controlling at SP1

6.7 Soft Start Timer
The timer is used to start a process at reduced power and/or reduced setpoint. Timing starts at power up or when 'Run' is selected.
When the Timer Status = Run, the controller power is limited by the soft start power limit parameter. The Soft Start setpoint is a threshold which, when exceeded, sets the timer to end. If the temperature is already above this threshold when the timer is set to run, the timer will time out immediately.
When the timer status = reset, the controller is controlling at SP1
### 6.8 To Operate the Timer

If the timer is configured, it can be operated in Level 1 or Level 2 as follows:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Action</th>
<th>Indication</th>
</tr>
</thead>
<tbody>
<tr>
<td>To Run the timer</td>
<td>Press and quickly release ¥ + ▲</td>
<td>Beacon — RUN = On</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Scrolling display - TIMER RUNNING</td>
</tr>
<tr>
<td>To Hold the timer</td>
<td>Press and quickly release ¥ + ▲</td>
<td>Beacon — RUN = Flashing</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Scrolling display - TIMER HOLD</td>
</tr>
<tr>
<td>To Reset the timer</td>
<td>Press and hold ¥ + ▲ for more than 1 second</td>
<td>Beacon — RUN = Off</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If the timer is a Dwell Type and configured to turn power off at the end of the timing period OFF will be displayed</td>
</tr>
<tr>
<td>To Reset the timer after it has timed out</td>
<td>Press and hold ¥ + ▲ for more than 1 second</td>
<td>Beacon — RUN = Off SPX = On if End Type = SP2</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Scrolling display - TIMER END</td>
</tr>
<tr>
<td>To Cancel the &quot;end&quot; output (if configured)</td>
<td>Press ¥ + ▲</td>
<td>If a logic (relay) output is configured to operate when the timer has timed out, it can be cancelled by pressing these two buttons (Hack)</td>
</tr>
</tbody>
</table>

Repeat the above to Run the timer again (Note: It is not essential to reset it after the End state is reached)

**Note 1:** When the timer has been reset, press ¥ + ▲ for more than 1 second to select Auto/Manual mode.

**Note 2:** The time can be extended by changing the T.REMN parameter. If the timer has timed out it will automatically run again.

Any output, not used for control, can be configured to operate while the timer is running and/or when it has timed out.

---

### 6.9 Programmer

Model type CP is a controller which also contains a four segment setpoint programmer where each segment consists of a controlled rate ramp to a target setpoint followed by a dwell at that setpoint. These values can be set by the user. The program profile is shown in the diagram below.
Notes:
Where steps are required, the ramp rate in the ramp/dwell pair should be set to ‘OFF’.
1. Where ramp/dwell pairs are not required, the ramp rate should be set to ‘OFF’ and the TSP the same as the preceding segment.
2. TIMER END - when end type is SP2, Timer END does not occur until the ramp is complete or SP2 is achieved. It is more usual to use a DWELL end type (the default setting).

6.9.1 Power Cycling (Programmer)
If the power is turned off while the programmer is running the program will reset when the power to the controller is turned back on.

6.9.2 Threshold
A single threshold value is available to provide a holdback on the entry to the dwell part of the ramp/dwell pair. It holds back the dwell until the PV has reached the band defined by +/- threshold around the PV as shown below:

![Diagram of Power Cycling (Programmer)]

3216 User Guide Part No. HA027985ENG Issue 2.0 May 04

6.9.3 To Operate the Programmer
Operation of the programmer is the same as the timer.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Action</th>
<th>Indication</th>
</tr>
</thead>
<tbody>
<tr>
<td>To Run a program</td>
<td>Press and quickly release (\uparrow) + (\downarrow)</td>
<td>Beacon -- RUN = On&lt;br&gt;Scrolling display - TIMER RUNNING</td>
</tr>
<tr>
<td>To Hold a program</td>
<td>Press and quickly release (\uparrow) + (\downarrow)</td>
<td>Beacon -- RUN = Flashing&lt;br&gt;Scrolling display - TIMER HOLD</td>
</tr>
<tr>
<td>To Reset a program</td>
<td>Press and hold (\uparrow) + (\downarrow) for more than 1 second</td>
<td>Beacon -- RUN = Off&lt;br&gt;SPX = On if End Type = SP2&lt;br&gt;if the programmer is configured to turn power off at the end of the timing period OFF will be displayed.</td>
</tr>
<tr>
<td>Program ended</td>
<td></td>
<td>Beacon -- RUN = Off&lt;br&gt;SPX = On if End Type = SP2&lt;br&gt;if the programmer is configured to turn power off at the end of the timing period OFF will be displayed.</td>
</tr>
<tr>
<td>To Reset a program after it has timed out</td>
<td>Press and hold (\uparrow) + (\downarrow) for more than 1 second</td>
<td>Beacon -- RUN = Off&lt;br&gt;SPX = On if End Type = SP2&lt;br&gt;if the programmer is configured to turn power off at the end of the timing period OFF will be displayed.</td>
</tr>
<tr>
<td>To Cancel the ‘end’ (relay) output (if configured)</td>
<td>Press (\uparrow) + (\downarrow)</td>
<td>If a logic (relay) output is configured to operate when the programmer has timed out, it can be cancelled by pressing these two buttons (Ack).</td>
</tr>
</tbody>
</table>

Repeat the above to run the programmer again (Note: it is not essential to reset it after the End state is reached).

Programs can also be operated from the ‘T. STAT’ parameter found in the level 2 parameter list.

3216 User Guide Part No. HA027985ENG Issue 2.0 May 04
### 6.9.4 To Configure the Programmer

Select Access Level 2 - see section 6.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Action</th>
<th>Indication</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configure the Timer as a</td>
<td>1. Press ( ) as many times as necessary to ‘TM_CFG’</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Programmer</td>
<td>2. Press ( ) or ( ) to ‘PROG’</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Set the Resolution</td>
<td>3. Press ( ) as many times as necessary to ‘TM_RES’</td>
<td></td>
<td>In this example the ramp rate and dwell period are set in hours</td>
</tr>
<tr>
<td></td>
<td>Press ( ) or ( ) to ‘Hour’ or ‘min’</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Set the Threshold</td>
<td>4. Press ( ) as many times as necessary to ‘THRES’</td>
<td></td>
<td>In this example the dwell periods will not start until the PV is</td>
</tr>
<tr>
<td></td>
<td>5. Press ( ) or ( ) to adjust</td>
<td></td>
<td>within 5 units of the setpoint</td>
</tr>
</tbody>
</table>

### 6.12.2 Set the Servo Mode

6. Press ( ) as many times as necessary to ‘SERVO’

7. Press ( ) or ( ) to ‘PU’ or ‘SP’.

In this example the program will start from the current value of the process variable

### 6.12.3 Set the first Target Setpoint

8. Press ( ) as many times as necessary to ‘TSP.1’

9. Press ( ) or ( ) to adjust

In this example the setpoint will ramp from the current value of the PV to the first target - 100

### 6.12.4 Set the first Ramp Rate

10. Press ( ) as many times as necessary to ‘RMP.1’

11. Press ( ) or ( ) to adjust

In this example the setpoint will ramp to 100 at 8.0 units per hour

### 6.12.5 Set the first Dwell

12. Press ( ) as many times as necessary to ‘DWEL.1’

13. Press ( ) or ( ) to adjust

In this example the setpoint will dwell at 100 for 2 hours 11 minutes

Repeat the above three steps for all segments
